

# Late-Breaking Data Show Esprit™ BTK Drug-Eluting Resorbable Scaffold Reduces Chronic Limb-Threatening Ischemia Progression Compared To The Standard Of Care

- Abbott's new investigational drug-eluting Esprit BTK (below-the-knee) resorbable scaffold is made of naturally dissolving material that disappears over time after it's opened a clogged artery
- There is a significant need for more treatments: there are currently no drug-eluting stents, drug-coated balloons or bare-metal stents approved for below the knee (BTK) use in the U.S.
- Abbott's landmark LIFE-BTK randomized clinical trial met its primary safety and effectiveness endpoints, demonstrating that Esprit BTK offers significant advancements in opening and keeping blocked arteries below-the-knee open compared to the standard of care, balloon angioplasty

SAN FRANCISCO, Oct. 25, 2023 /PRNewswire/ -- Abbott (NYSE: ABT) today announced late-breaking data from the LIFE-BTK clinical trial evaluating the Esprit™ BTK Everolimus Eluting Resorbable Scaffold System (Esprit BTK) in people with chronic limb-threatening ischemia (CLTI). CLTI is a severe stage of peripheral artery disease (PAD) due to advanced arterial blockage in the lower extremities. The LIFE-BTK trial met both of its primary safety and effectiveness endpoints, demonstrating that Esprit BTK reduces disease progression and helps improve medical outcomes compared to the current standard of care, balloon angioplasty.

Data from LIFE-BTK was presented as a late-breaking clinical trial at the [35th Transcatheter Cardiovascular Therapeutics \(TCT\) Conference](#) in San Francisco and simultaneously published in the [New England Journal of Medicine](#)

"Millions of people suffer from PAD. Yet, in the United States, there are currently no approved drug-eluting stents, drug-coated balloons or bare-metal stents available for use below-the-knee," said Brian DeRubertis, MD, FACS, New York Presbyterian-Weill Cornell Medical Center, and one of the principal investigators in the trial. "This underscores a pressing and substantial need for improved treatment options for people with CLTI and PAD. Results from the LIFE-BTK trial highlight the efficacy of Esprit BTK and its potential to deliver significant benefits in terms of opening blocked arteries below-the-knee and providing sustained treatment over time."

More than 200 million people worldwide have PAD with nearly 11% affected by CLTI<sup>1,2</sup>, a severe form of PAD. In these people, blocked vessels impair blood flow to the lower extremities, often leading to severe pain, non-healing wounds, and, in some cases, the need for limb amputation. Balloon angioplasty, a procedure in which a small balloon is inserted into the artery to open the blockage, is currently one of the approved procedures for people in the U.S. with CLTI. However, in many instances, the vessels become blocked again over time following balloon angioplasty, requiring additional treatment.

Abbott's Esprit BTK is a drug-eluting resorbable scaffold comprised of materials similar to dissolving sutures. Unlike metal stents, Esprit BTK is not a permanent implant, as blocked vessels only need support for a few months after the blockage is cleared. At that point, the vessel can stay open on its own, which is why Esprit BTK is designed to serve a temporary, yet crucial role.

The LIFE-BTK trial enrolled 261 people worldwide. The study aimed to investigate whether Esprit BTK could offer greater benefits than the current option of balloon angioplasty to open blocked arteries in the leg and to keep the arteries open. The trial's primary efficacy endpoint evaluated primary patency plus limb salvage (the ability of the vessel to stay open, and increasing the time until another intervention is needed). The trial met the efficacy endpoint and showed that Esprit BTK is superior to balloon angioplasty in lowering the risk of total obstruction of the target vessel, narrowing of the target lesion, major amputation and repeat interventions of the target lesion. The primary safety endpoint evaluating freedom from above-the-ankle amputation, major reintervention at six-months and death within 30-days showed that Esprit BTK was non-inferior (similar performance) to balloon angioplasty.

## Results of the one-year LIFE-BTK clinical trial showed:

- Esprit BTK had a significantly greater freedom from the primary efficacy clinical events of 74.5 vs 43.7% (balloon angioplasty) for people with CLTI.
- The trial's powered secondary endpoints revealed that Esprit BTK was superior to balloon angioplasty at reducing vessel re-narrowing (25.8% improvement) and sustaining openness of the vessels (14.2% improvement).

"The LIFE-BTK trial data underscores the profound impact that Esprit BTK could have for millions with PAD," said Jennifer Jones-McMeans, divisional vice president of global clinical affairs at Abbott's vascular business. "With angioplasty, multiple interventions are all too common. The results from this trial demonstrate a compelling and meaningful development in clinical outcomes, ultimately helping people have less adverse events and reinterventions, enhancing their quality of life."

Based on the strength of the LIFE-BTK trial results, Abbott intends to submit the Esprit BTK Everolimus Eluting Resorbable Scaffold System for review by the U.S. Food and Drug Administration (FDA).

**CAUTION:** Investigational device. Limited by Federal (U.S.) law to investigational use only.

## About Abbott:

Abbott is a global healthcare leader that helps people live more fully at all stages of life. Our portfolio of life-changing

technologies spans the spectrum of healthcare, with leading businesses and products in diagnostics, medical devices, nutritionals and branded generic medicines. Our 115,000 colleagues serve people in more than 160 countries.
