## **Cision® Acquires ShareIQ Visual Recognition Technology**

## **Cision Communications Cloud® Becomes First Earned Media Platform to Measure, Analyze and Optimize Performance of Visual Content Across All Channels**

CHICAGO, July 30, 2018 /<u>PRNewswire</u>/ -- Cision (NYSE: CISN) today announced it has acquired the technical assets of Berlin-based SharelQ. The SharelQ platform is based on patent-pending technology that discovers, analyzes and indexes original pieces of visual content, as well as shared and republished copies of specific images. With the addition of SharelQ technology to the Cision Communications Cloud, Cision becomes the first earned media platform in the industry to monitor, analyze and attribute value to both text and visual content.

"Cision Comms Cloud<sup>™</sup> is the technology enabler for earned media management, a new discipline in which professional communicators are able to combine the art of storytelling with the power and science of data to establish communications as a critical driver of business value," said Kevin Akeroyd, Cision CEO. "With more than three billion images uploaded to the web each day and more than 95 million images added to channels like Instagram daily, earned media is becoming increasingly visual. SharelQ is the latest of our carefully curated technology acquisitions designed to make the Cision Comms Cloud the most robust in the industry – and the first to provide comms professionals with a way to harness the true business impact of the visual content market."

Conventional monitoring methods rely on text and hashtag capture to track images and logos. But because the bulk of internet-based images are not associated with text or hashtags, conventional systems lack the ability to truly track and measure the impact of visual content. SharelQ technology is the first to recognize brand images and logos independent of text and hashtags across all social, web, and digital channels.

The SharelQ solution maps the history and path of each image to provide reach and engagement, as well as insight into where the image is being shared and by whom – a publisher or an individual influencer.

Additionally, SharelQ provides the ability to create custom audiences of individuals who have viewed, liked, or shared specific visual content. When used in conjunction with Cision's established partnerships like LiveRamp® and MediaMath®, these audiences can be uploaded to any Data Management Platform to facilitate targeted digital advertising.

SharelQ can track brand-generated, user-generated, and influencer-generated images as well as track and analyze the brand's competitive visual content.

SharelQ technology will be immediately available to current Cision Comms Cloud customers. It is the company's aim to integrate SharelQ technology into our platform workflow by the end of this year for seamless targeting, distribution and analysis of visual earned media marketing efforts.
